Beschrijving

The Raspberry Pi GPIO terminal breakout board is designed to break out from the 26 pin header on the Raspberry Pi. This breakout board eliminates the need for a breadboard with the use of lever terminals. Simply lift the levers up and insert the cable into the hole and let go of the lever to clamp the cable into the terminal. The terminal breakout board has clear printed labels for GPIO pins on to avoid incorrect wiring.

Contents: Fully assembled terminal breakout board, 26 way 200mm rainbow ribbon cable, instructions
